

## Claim Listing

Please Amend the Claims as Indicated:

1. (Currently Amended) A method for providing a plurality of sequential data words, said method comprising:

receiving a command to provide the plurality of sequential data words, wherein the plurality of sequential data words comprises a first data word and a last data word and one or more data words between the first data word and the last data word, occupying an amount of memory in a first memory;

fetching a sequential portion of the sequential data words, said sequential portion comprising a first intermediate word, the last word, and one or more data words between the intermediate word and the last word;

identically storing the [identical] sequential portion, in a second memory comprising less than the amount of memory occupied by the plurality of sequential data words in the first memory;

transmitting at least a portion of the last data word; and

transmitting at least a portion of the intermediate data words after transmitting at least the portion of the last data word.

2. (Currently Amended) The method of claim 1, further comprising:

fetching another sequential portion of the sequential data words, the another sequential portion comprising a second intermediate data word, immediately followed one or more data words, immediately followed by a third intermediate data word, the third intermediate data word immediately preceding the first intermediate word;

identically storing the identical another sequential portion;

transmitting at least a portion of the third intermediate word; and

transmitting at least a portion of the second intermediate word after transmitting at least the portion of the third intermediate word.

3. (Previously Presented) The method of claim 1, wherein storing further comprises:

storing the sequential portion in the second memory, the second memory having a beginning address and an ending address, and wherein at least the portion of the last data word is stored at the ending address and wherein at least the portion of the first intermediate word is stored in the beginning address.

4. (Previously Presented) The method of claim 3, wherein the second memory is characterized by a width, and the data words are characterized by a width, the width of the second memory being smaller than the width of the data words.

5. (Original) The method of claim 3, wherein the last data word comprises at least the portion of the last data word and at least another portion, wherein at least the portion comprises the least significant bits of the last data word, and wherein the at least another portion comprises the most significant bits of the last data word, and wherein storing the portion further comprises:

storing the at least another portion of the last data word at an address preceding the ending address.

6. (Original) The method of claim 5, further comprising:

transmitting the at least another portion of the last word after transmitting at least the portion of the last word.

7. (Original) The method of claim 1, wherein the one or more data words comprise a predetermined number of data words.

8. (Original) The method of claim 1, wherein the plurality of sequential data words stores a video packet.

9. (Currently Amended) A system for providing a plurality of sequential data words, said method comprising:

a state logic machine for receiving a command to provide the plurality of sequential data words, wherein the plurality of sequential data words comprises a first data word and a last data word, and one or more data words between the first data word and the last data word, and wherein the plurality of sequential data words occupy an amount of memory in a first memory;

a memory controller for fetching a sequential portion of the sequential data words, said sequential portion comprising a first intermediate word, the last word, and one or more data words between the intermediate word and the last word;

a local buffer for identically storing the [identical] sequential portion, comprising less than the amount of memory occupied by the plurality of sequential data words in the first memory; and

a port for transmitting at least a portion of the last data word and transmitting at least a portion of the intermediate data words after transmitting at least the portion of the last data word.

10. (Currently Amended) The system of claim 9, wherein:

the memory controller fetches another sequential portion of the sequential data words, the another sequential portion comprising a second intermediate data word, immediately followed one or more data words, immediately followed by a third intermediate data word, the third intermediate data word immediately preceding the first intermediate word;

the local buffer identically stores the [identical] another sequential portion;  
and

the port transmits at least a portion of the third intermediate word and transmits at least a portion of the second intermediate word after transmitting at least the portion of the third intermediate word.

11. (Original) The system of claim 9, wherein the local buffer is associated with a beginning address and an ending address, and wherein a memory location at the ending address stores at least the portion of the last data word and wherein at memory

location at the beginning address stores at least the portion of the first intermediate word.

12. (Original) The system of claim 11, wherein the local buffer is characterized by a width, and the data words are characterized by a width, the width of the local buffer being smaller than the width of the data words.

13. (Original) The system of claim 11, wherein the last data word comprises at least the portion of the last data word and at least another portion, wherein at least the portion comprises the least significant bits of the last data word, and wherein the at least another portion comprises the most significant bits of the last data word, and wherein a memory location at an address preceding the ending address stores the at least another portion of the last data word.

14. (Original) The system of claim 13, wherein the port transmits the at least another portion of the last word after transmitting at least the portion of the last word.

15. (Original) The system of claim 9, wherein the one or more data words comprise a predetermined number of data words.

16. (Original) The system of claim 9, wherein the plurality of sequential data words stores a video packet.

17. (Currently Amended) A system for decoding a video packet, said system comprising:

a compressed data buffer comprising a plurality of sequential data words, the plurality of sequential data words for storing a video packet, and wherein the plurality of sequential data words occupy an amount of memory in the compressed data buffer;

a video decoder for decoding the video packet; and

a direct memory access engine for providing the video packet to the video decoder, the direct memory access engine comprising:

a state logic machine for receiving a command to provide the plurality of sequential data words and a control signal indicating reverse order from the video decoder, wherein the plurality of sequential data words comprises a first data word and a last data word, and one or more data words between the first data word and the last data word;

a memory controller for fetching a sequential portion of the sequential data words, said sequential portion comprising a first intermediate word, the last word, and one or more data words between the intermediate word and the last word;

a local buffer for identically storing the [identical] sequential portion, comprising less than the amount of memory occupied by the plurality of sequential data words in the compressed data buffer; and

a port for transmitting at least a portion of the last data word and transmitting at least a portion of the intermediate data words after transmitting at least the portion of the last data word.
